The First Humans: Origin And Early Evolution Of The Genus Homo (Vertebrate Paleobiology And Paleoanthropology)

Synopsis

There are some issues in human paleontology that seem to be timeless. Most deal with the origin and early evolution of our own genus. There is something about which we should care. Some of these issues pertain to taxonomy and systematics. How many species of *Homo* were there in the Pliocene and Pleistocene? How do we identify the earliest members of the genus *Homo*? If there is more than one Plio-Pleistocene species, how do they relate to one another, and where and when did they evolve? Other issues relate to questions about body size, proportions and the functional adaptations of the locomotor skeleton. When did the human postcranial "Bauplan" evolve, and for what reasons? What behaviors (and what behavioral limitations) can be inferred from the postcranial bones that have been attributed to *Homo habilis* and *Homo erectus*? Still other issues relate to growth, development and life history strategies, and the biological and archeological evidence for diet and behavior in early *Homo*. It is often argued that dietary change played an important role in the origin and early evolution of our genus, with stone tools opening up scavenging and hunting opportunities that would have added meat protein to the diet of *Homo*. Still other issues relate to the environmental and climatic context in which this genus evolved.

Book Information

Series: Vertebrate Paleobiology and Paleoanthropology

Hardcover: 220 pages

Publisher: Springer; 2009 edition (June 9, 2009)

Language: English

ISBN-10: 1402099797

ISBN-13: 978-1402099793

Product Dimensions: 11.1 x 8.5 x 0.8 inches

Shipping Weight: 2 pounds (View shipping rates and policies)

Average Customer Review: 5.0 out of 5 stars 2 customer reviews

Best Sellers Rank: #627,157 in Books (See Top 100 in Books) #18 in Books > Science & Math > Biological Sciences > Paleontology > Paleobiology #2326 in Books > Politics & Social Sciences > Anthropology > General #2961 in Books > Textbooks > Social Sciences > Anthropology

Customer Reviews

From the reviews: "This volume provides an up-to-date, concise synthesis of what is known about early *Homo* and highlights what still remains to be done." Journal of Human Evolution, 2009

This volume addresses the origin of the human genus *Homo*, a major transition in human evolution and associated with major changes in brain size, locomotion, and culture, but one with many unanswered questions. How many different species of *Homo* were there, and how were they interrelated? Are stone tools a characteristic of early *Homo*? What was their function? How does the use of stone tools relate to changes in the dentition and brain size? Did adaptations for long distance running first appear with the origin of this genus? How does this relate to its diet and cultural abilities.

Quality information that everyone should know.

I can already tell this is going to be great.
